

Applying phonology in lexicography: variant-synonym classification in Czech Sign Language

Hana Strachonová hana.strachonova@mail.muni.cz, Lucia Vlášková l.vlaskova@gmail.com

1. Problem

This poster focuses on the **variant/synonym classification** in the first online lexical database of Czech SL (*Dictio*), as part of the lemmatisation problem. **Lemmatisation issues** for sign languages are more similar to those of spoken languages that lack standard writing systems than that with standard orthographies (Fenlon et al. 2015). Researches have noted that a **pair of signs is likely to be variants** in case they **differ in just one parameter** (Fenlon et al. 2015). Parameters (in SL: hand configuration, place of articulation, movement) may act as **phonemes** and create minimal pairs (ŠBAR and ŠBRNO differ only in one parameter: hand configuration → orientation). Thus the starting point in the variant/synonym classification is to affirm that the lexemes share the same meaning. We are using the Hand-Tier (H-T) model (Sandler & Lillo-Martin 2006; S&LM) due to its fitting description of the data we are working with. Other phonological models such as Move-Hold model (Liddell & Johnson 1989) or Brentari's (1998) Prosodic model cannot accurately capture the subtle contrasts important in this lexicographic task. Our research contributes the following: a) **empirical** level: phonological description of (deeply understudied) Czech SL – at the moment, we build on a study of **300 phonologically related pairs** of variants/synonyms; b) **practical** level: classification of Czech SL lexemes in *Dictio* (resolving a part of **lemmatisation issues** in the dictionary); c) **theoretical** level: refinement of the requirement for **minimal difference** in SL variants. We specify what is covered by the "one parameter" criterion. Additionally, we work out the exact position and function of the **features [rep] – repetition and [contact]** in the H-T model, and, in consequence, we update the model for the secondary movement.

2. Model

Non-dominant hand:

Sandler (1995) lists the **unmarked handshapes** for ASL. No research for Czech SL yet.

Different number of hands

We classify the pairs that result from the weak drop as having a different place. Weak drop is a postlexical process observed by non-symmetrical two-handed signs that consist in the deletion of the non-dominant hand (hand 2 → neutral place); e.g., ŠVIDEO_1 and ŠVIDEO_2

Orientation of the hand is always evaluated with respect to the place of articulation: variants ŠBROTHER_IN_LAW_1 and ŠBROTHER_IN_LAW_2 do not differ in orientation, since in both cases, the dominant hand contacts the place of articulation with the ulnar side.

Following S&LM, we analyze **circular movement** as a combination of [arc] and [convex] features.

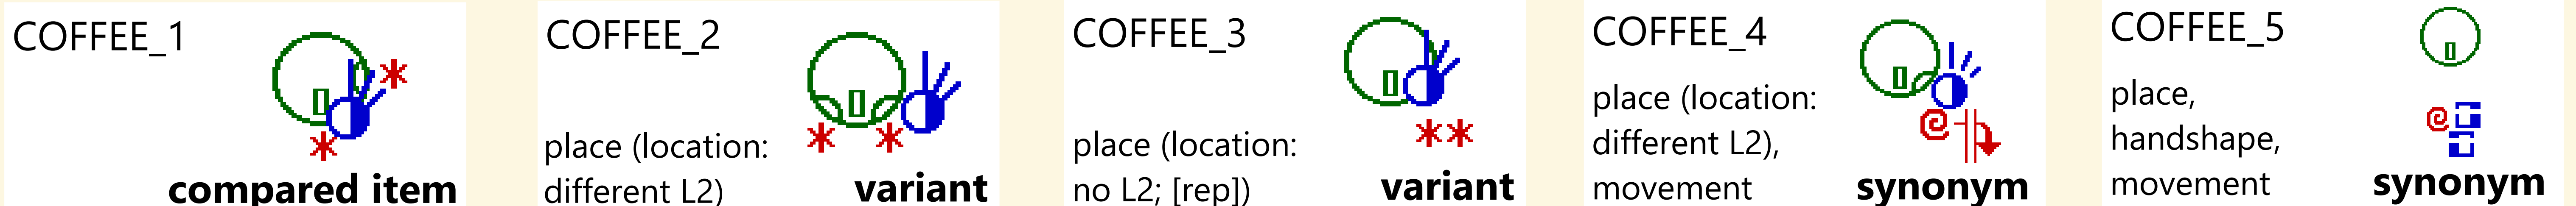

Symmetrical two-handed signs and their one-handed variants differ in the engagement of hand 2 (copy of hand 1); e.g., ŠRAW_1 and ŠRAW_2.

Mouthing and mouth gestures usually bear a lexical difference e.g., ŠDINNER and ŠBREAKFAST (signs that contain the manual part for ŠEAT and differ by the mouthing of Czech words for *dinner* and *breakfast*). To find a phonological role is rare; e.g., different mouth gestures in ŠRUDE_1 and ŠRUDE_2. Mouthing exhibits idiolectal variation, typically in the number of syllables of the corresponding spoken equivalent, which is being silently articulated. Since the phonological status of mouthing and mouth gestures is not clear, these categories are not included in the H-T model and our analysis at the moment.

3. Discussion

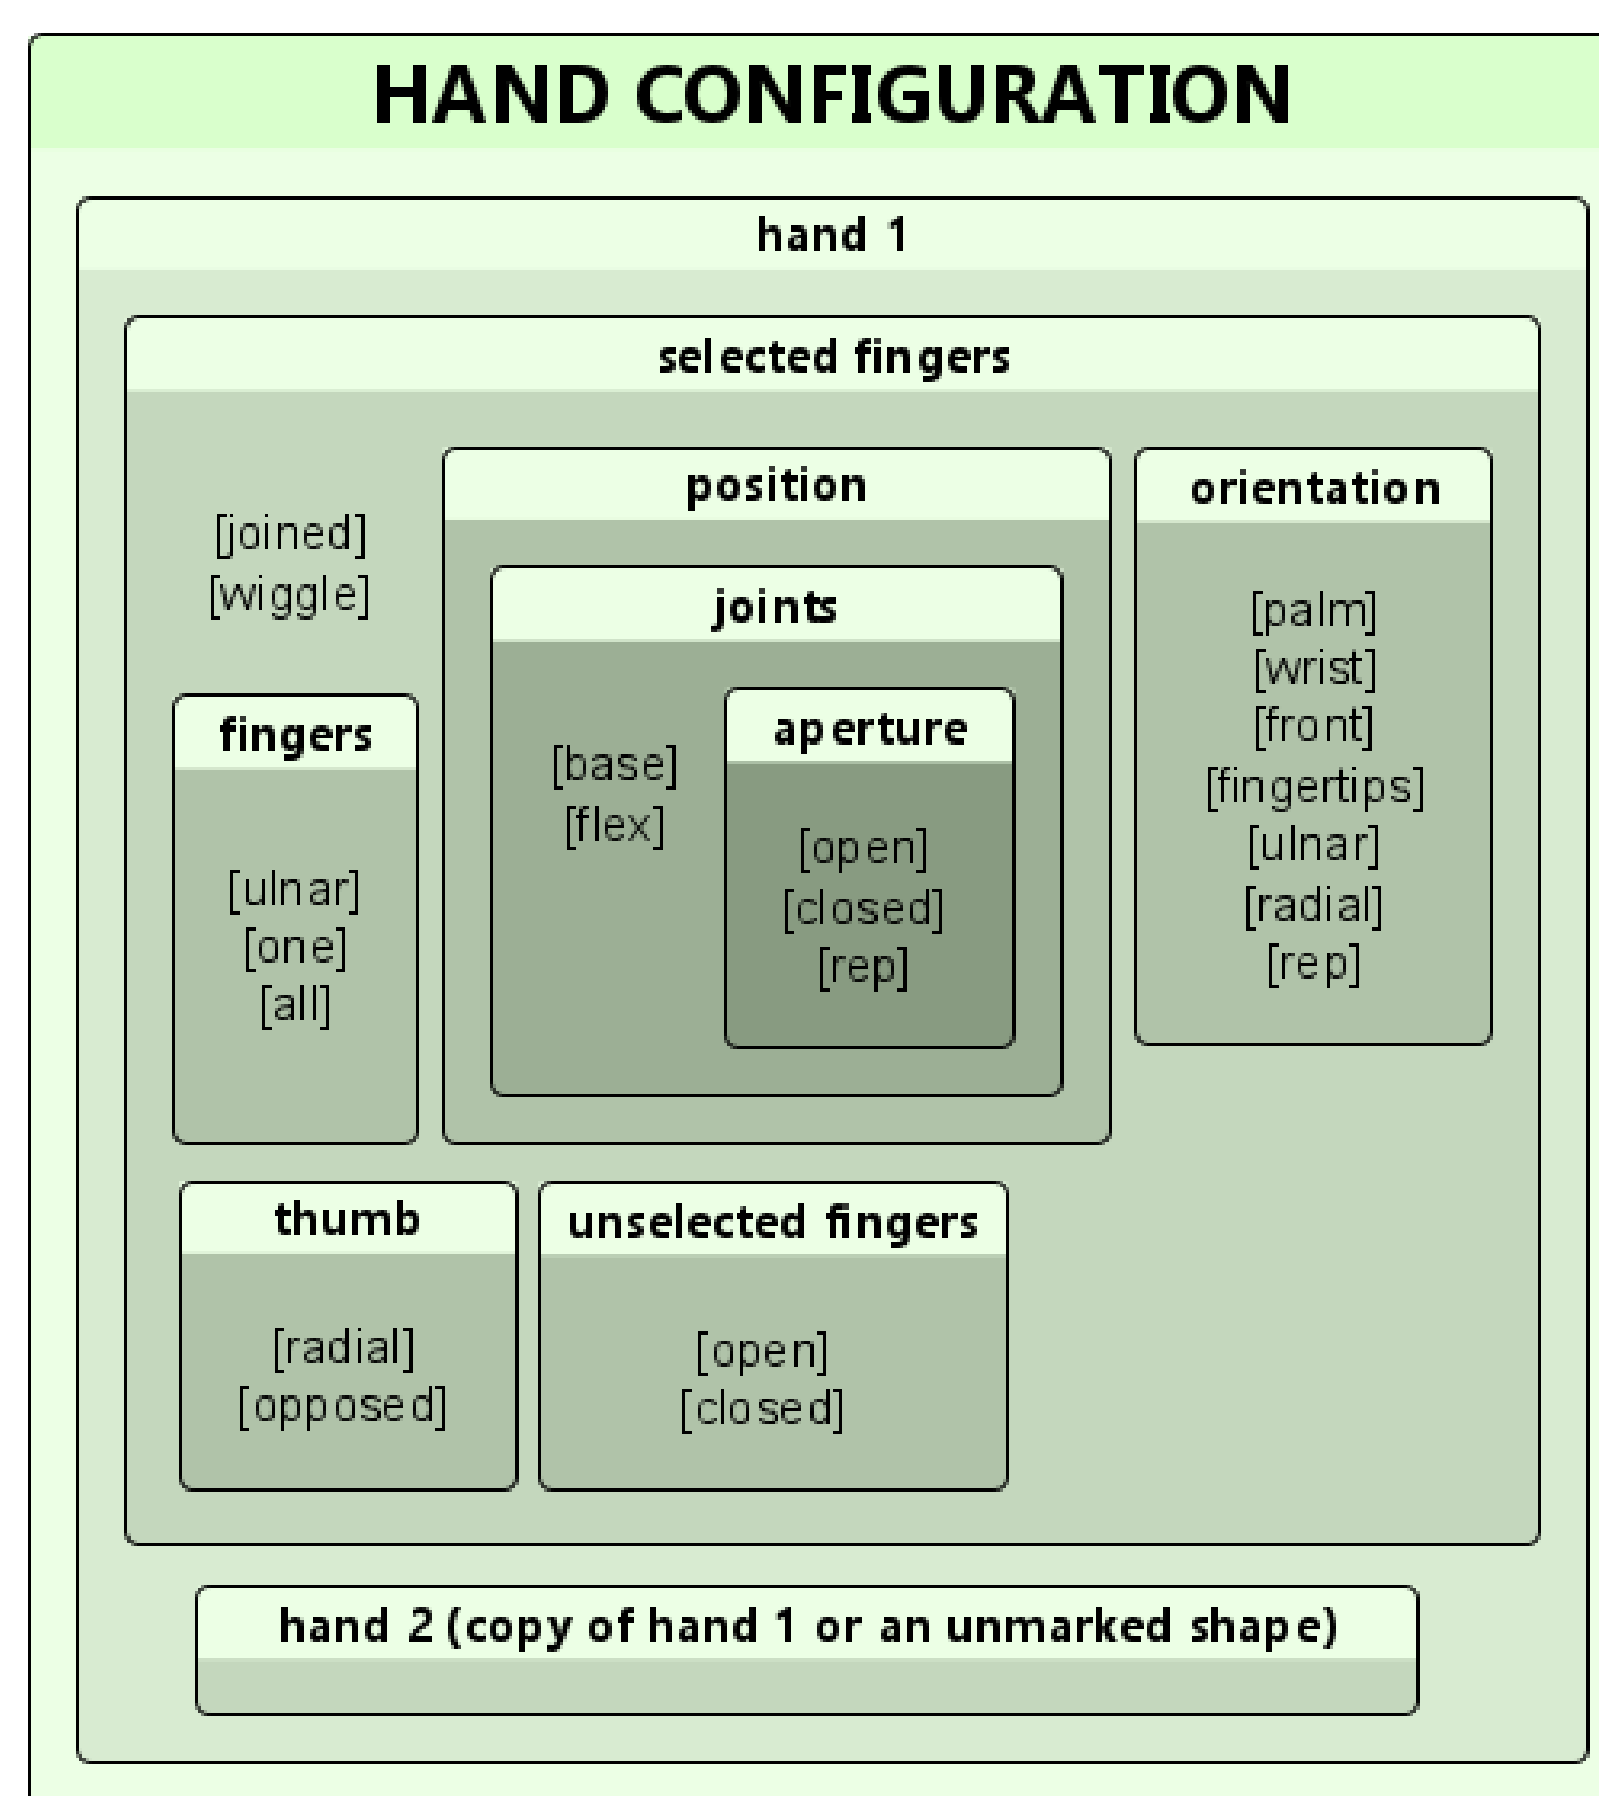

Criterion for variant/synonym distinction: equivalent meaning and minimal formal difference. **One parameter changes** → **variants**; **two and more parameters change** → **synonyms**. As parameters we understand handshape, place and movement (Fenlon et al. 2015 consider also orientation while classifying the variants but in H-T model, orientation is a subcategory of hand configuration).

Work in progress: 300 phonologically related pairs: 258 variant-pairs (ŠCOFFEE_2 and ŠCOFFEE_3), 42 synonym-pairs (ŠCOFFEE_4 and ŠCOFFEE_5). **Aims:** i) classification of the complete language sample in *Dictio*; ii) typology of variation in Czech SL (statistics for parameters and categories).

The **terminal features** are taken from S&LM.

Refinement of one parameter criterion: variant-pairs with more than one different value within a single parameter

3 differences within **HC**: ŠTUNISIA_1 (position of fingers: [open], [closed], [rep], unselected fingers: [closed]) and ŠTUNISIA_2 (position of fingers: [closed], unselected fingers: [open]).

2 differences within **place**: ŠFOURTEEN_1 (selected fingers: [0], orientation: [radial]) and ŠFOURTEEN_2 (selected fingers: [one], orientation: [palm]), different location follows from the orientation of hand 2 (hence phonetics).

TUNISIA

FOURTEEN

S&LM (2006) mention **[rep]**, but the exact definition and place in the H-T model remains unclear.

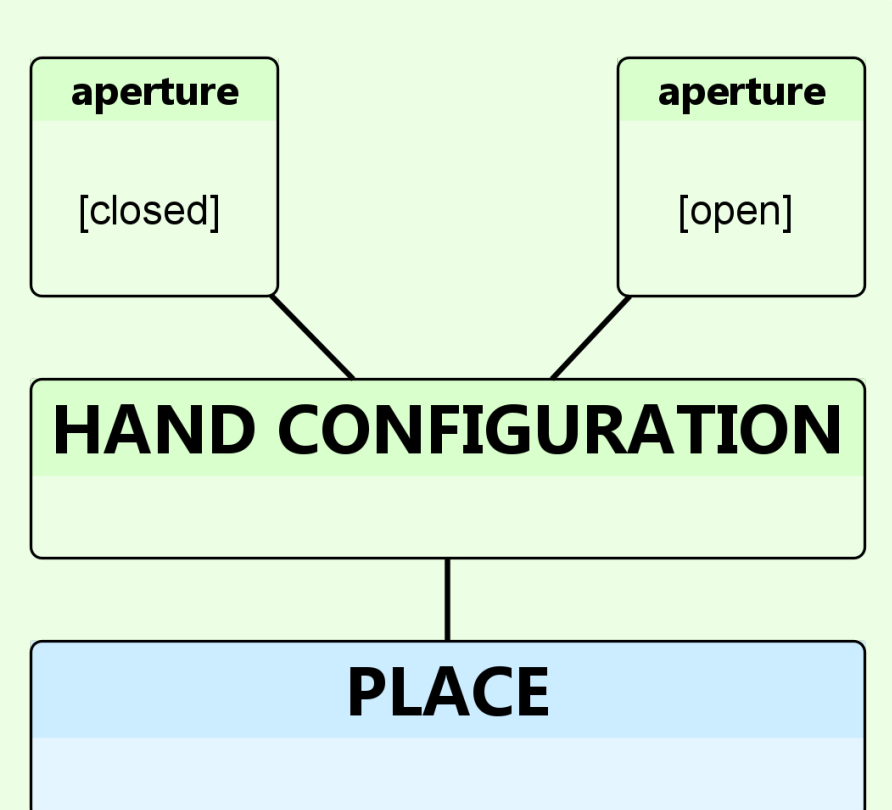

We apply [rep] in one vs. several movement-pairs (e.g., ŠWHY_1 and ŠWHY_2); on the basis of existing lexical minimal pairs (ŠMORNING and ŠCLOTHES).

We do not apply [rep] in *n* vs. *n+1* movement-pairs (e.g., ŠCHRISTMAS_1 vs. ŠCHRISTMAS_2), because phonological status of such a contrast is unattested. We classify the pairs as phonetic variants.

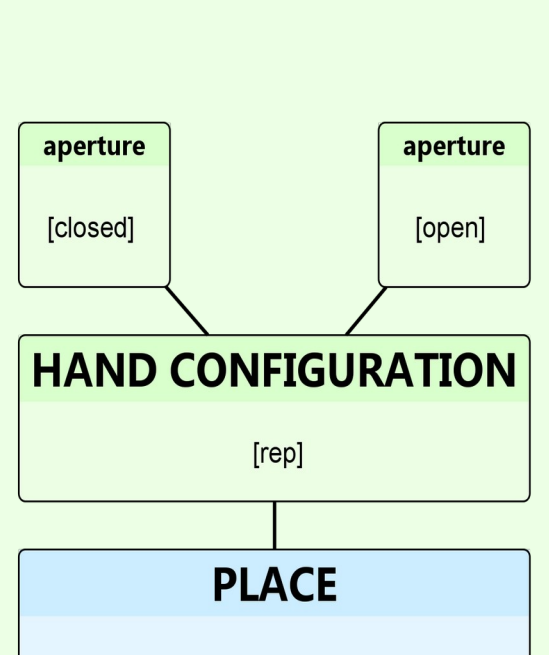

We place [rep] under all the categories: **HC** (position → aperture: ŠSHOWER, orientation: ŠNO), **movement** (ŠSEPTEMBER), and **place** ŠFIT (together with [contact]).

In H-T model, **internal movement** belongs to **HC**, unlike Brentari's (1998) Prosodic model, which unifies path and internal movement into a single category.

There are two types of internal movement: i) opening/closing of the hand (e.g., ŠLAMP) and ii) orientation change (e.g., ŠTRANSLATE), which we analyze as branching of the aperture or orientation features, respectively.

Secondary movement is defined as quick repeating change of position or orientation of the hand, and finger wiggle (S&LM 2006: 197); the representation in the model is not explicitly given in S&LM (2006). We decompose secondary movement into [rep] and **HC** subcategories: position → aperture (e.g., ŠSHOWER) and orientation (e.g., ŠNO); or place [wiggle] at selected fingers (e.g., ŠISRAEL).

The feature **[contact]** can appear on **movement** (e.g., ŠNUDE), **place** (e.g., ŠREMEMBER), or explicitly on a location, if specified (e.g., ŠTRUTH).
